

For this project, we were tasked with disproving Kant's idea that color is only used as a use as an appeal to the sense and does not make something more beautiful. I proved that color is important in our world as I took an image and used subtractive color with it (CMYK) and another version where I used additive color (RGB). For the additive color version, I separated the different layers and played around with them by changing the sizes of the layers and moving them so we could see how each color played a part in making the photo as we could see the layers by themselves in some parts but also how they crossover and make the image. For the subtractive color, I just changed the image color mode and the layer meshing as we could see how it changed the image. With these different modes of the image, additive, normal, and subtractive, we could see how color plays a part in images and the world.
